**Project 3: Data Visualizations**

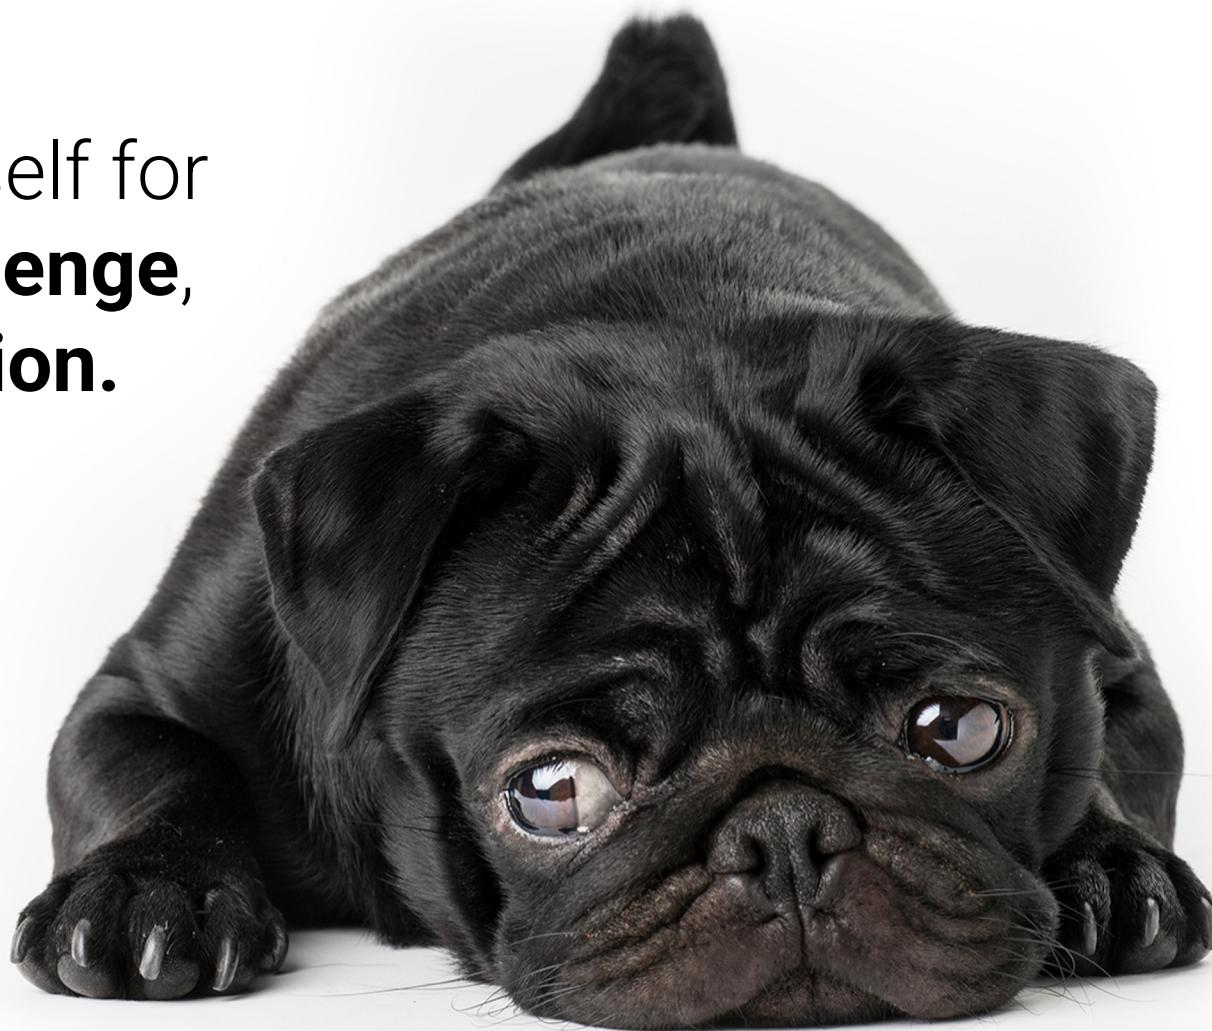

**Final Project: Machine Learning**

# Helpful Tips

A close-up photograph of a baby with light blue eyes and a wide-open mouth, appearing surprised or excited. The baby is wearing a bright pink, zippered jacket. The background is a dark, textured surface covered in numerous small water droplets, suggesting rain on a window. The overall composition conveys a sense of wonder and playfulness.

Embrace your  
inner toddler.

Brace yourself for  
**doubt, challenge,**  
and **confusion.**

There is no shortcut.

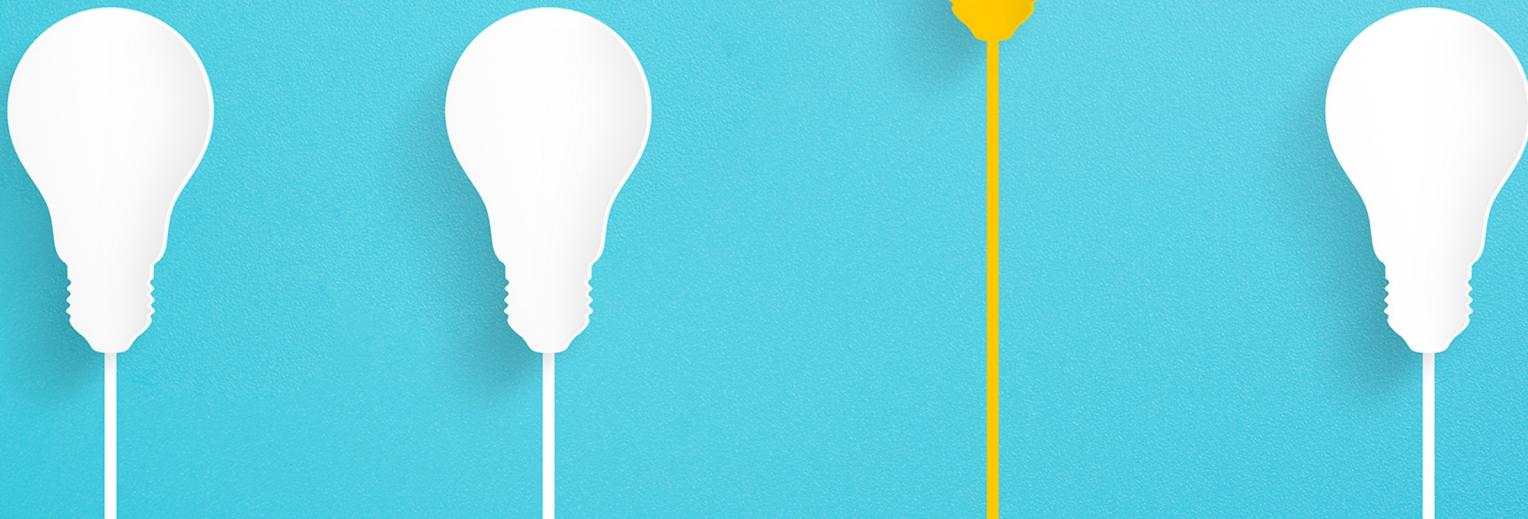

You've got to **put in the hours!**

Form a community  
with your classmates.

Enjoy the **novice experience**  
and expect a lot of  
**lightbulb moments.**

A close-up photograph of a fluffy orange and white cat lying on its back on a light-colored, textured surface. The cat's eyes are closed, and it has a content expression. Its front paws are raised, and its pink paw pads are visible. The background is slightly blurred.

**Celebrate your successes!**

# Group Activity:

Form groups of 3 or 4 people. Introduce yourself to your group.

Get up from your seats and walk around.

Don't be shy!

Suggested Time:

---

10 minutes

*Break*

# Group Activity: The Great Debate

Find the group you formed before the break.  
Together, ponder the following question.

Suggested Time:

---

20 minutes

# Group Activity: The Great Debate

---

Which food do Americans prefer:  
Italian or Mexican food?

# Group Activity: The Great Debate

---

With your group, develop a strategy for answering this question with as much confidence possible. Specifically, answer questions like:

What data will you attempt to gather?

What relationships will you be looking for?

How will you ensure your answer is most likely “true”?

## Assumptions:

You are given 5 hours and a budget of \$10 to accomplish this.

Your answer will be tested by randomly selecting 9 Americans who will each be asked the question—with 0 qualifiers.

You only have your team.

# The Great Debate (Analyzed)

# **Step 1: Decompose the “Ask”**

## Step 1: Decompose the “Ask”

---

Which food do **Americans** prefer:  
Italian or Mexican food?

## Step 1: Decompose the “Ask”

---

Which food do **Americans** prefer: Italian or Mexican food?

Who exactly is an **American**?

Are **Americans** just homeowners?

Do **Americans** just live in big cities?

Are **Americans** just millennials?

How can we get a representative  
sample of Americans?

## Step 1: Decompose the “Ask”

---

Which do Americans **prefer**:  
Italian or Mexican food?

# Step 1: Decompose the “Ask”

---

Which do Americans **prefer**: Italian or Mexican food?

How do we define “preference”?

Do people prefer the foods they eat most frequently?

Do people prefer the foods they wish they could eat if cost was not an issue?

How uniform is the preference? Is it regionalized? Is it different by demographic?

Inherently, preference is subjective. We are going to need to make it objective.

## Step 1: Decompose the “Ask”

---

Which do Americans prefer:  
**Italian or Mexican food?**

Italian and Mexican are broad categories to pursue. We will have to narrow the scope.

# Step 1: Decompose the “Ask”

---

Which food do Americans prefer: **Italian or Mexican food?**

01

How do we categorize foods? Is pizza Italian? Is Taco Bell Mexican?

02

How do we categorize food? Does making pasta at home constitute Italian? Or are we just talking about restaurants?

03

Are we just talking about “best experiences”? Or are we including poorer versions of these foods?

# **Step 2: Identify Data Sources**

## Step 2: Identify Data Sources

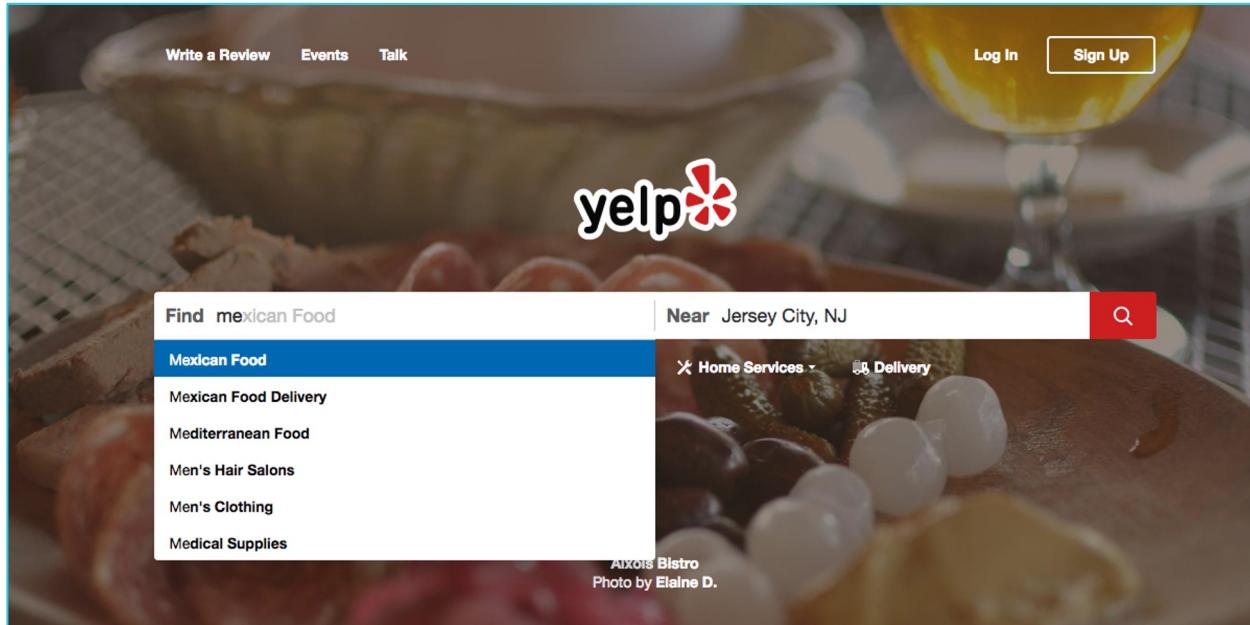

---

Why poll an audience when there are already enormous databases of information about Americans' food preferences—readily available online?

## Step 2: Identify Data Sources

As everyday consumers, we are **regularly** getting a pulse of everyday American food preferences to inform our own decisions. Perhaps we can make use of the same approach.

# Step 2a: Identify Data Sources

Web services like Yelp provide an almost-encyclopedic amount of information about the eating preferences of Americans.

The screenshot shows the Yelp website interface for the business "Mi Mariachi Taqueria". The URL in the address bar is <https://www.yelp.com/biz/mi-mariachi-taqueria-jersey-city-2>. The page features a red header with the Yelp logo, a search bar containing "Find tacos, cheap dinner, Max's" and "Near Jersey City, NJ", and buttons for "Log In" and "Sign Up". Below the header is a navigation bar with links for "Home Services", "Restaurants", "Auto Services", and "More", along with a "Write a Review" button. The main content area displays the business name "Mi Mariachi Taqueria" with an "Unclaimed" status, a 4-star rating from 230 reviews, and a "Write a Review" button. It also includes a "Mexican" cuisine type indicator and a map showing the location at 213 Sip Ave, Jersey City, NJ 07306. The page shows several images: a map of the area, the interior of the restaurant with tables and chairs, and a close-up of a sandwich labeled "Chorizo & egg sandwich no cheese. Simply... by Franco B.". A callout box indicates there are "See all 184" reviews. At the bottom, a testimonial reads, "'Love their Al Pastor and carnitas tacos, shredded lamb, pork ribs with salsa verde and their tamales!' in 13 reviews", and there are buttons for "Full menu" and "Price range Under \$10".

# **Step 3: Define Strategy and Metrics**

# Step 3: Define Strategy and Metrics

---

Here, we created a blueprint for what we're targeting:

Americans	<ul style="list-style-type: none"><li>Ideally, we need thousands of records from Americans in hundreds of cities. (Large samples)</li></ul>
Preference	<ul style="list-style-type: none"><li>Number of Yelp reviews (More = Preference)</li><li>Average aggregated ratings (Higher = Preference)</li></ul>
Italian and Mexican Food	<ul style="list-style-type: none"><li>Top-20 Italian restaurants and top-20 Mexican restaurants in every city</li></ul>

# Step 3: Define Strategy and Metrics

The screenshot shows the Yelp search interface with the query "Find Best Italian Food" and location "Near Jersey City, NJ". The results page displays 3356 entries, showing two cards for "Loradella's Family Pizzeria" and "Zero Otto Uno Cafe". Each card includes a thumbnail image, name, review count, phone number, address, a short description, and a "Start Order" button. A map on the right shows the locations of the top-rated businesses.

**Food Type** → Best Italian Food Jersey City, NJ

**Review Count** → Loradella's Family Pizzeria (108 reviews)

**Rating** → Zero Otto Uno Cafe (54 reviews)

Showing 1-30 of 3356

Mo' Map Redo search when map moved

Loradella's Family Pizzeria (551) 247-0754 126 River Dr S Jersey City, NJ

One of the best tasting pizza around Jersey City. Perfect sauce seasoned perfectly (not sweet out of the can taste) thin crust.... Finest cheese you can even order the Whole wheat..."

# **Step 4: Build Data Retrieval Plan**

# Step 4: Build Data Retrieval Plan

---

We could retrieve this data by brute force, but it would be:

- Extremely time-consuming
- Skewed by our city familiarity
- Labor intensive

The image displays three separate instances of a Yelp search interface, each with a red header and white body. Each instance shows the Yelp logo on the left, followed by a search bar containing "Find Mexican" and another search bar containing "Near [city, state]" with a search icon to its right. The three instances represent different locations: New York, NY; Denver, CO; and Oklahoma City, OK.

# Thank You, Yelp!

Thankfully, we can take advantage of the **Yelp Fusion API** to programmatically run our queries. (#ThankGoodnessForProgramming)

The screenshot shows the Yelp Fusion API documentation page. The top navigation bar includes the Yelp logo, 'Fusion', 'Fusion API', 'GraphQL', 'Manage App', and user profile icons. On the left, a sidebar menu lists 'General' (selected), 'Create App', 'Email / Notifications', 'Display Requirements', 'Terms of Use', and 'FAQ'. Under 'Yelp Fusion', 'Business Search' is selected, while 'Introduction' and 'Phone Search' are also listed. The main content area is titled '/businesses/search' and describes it as an endpoint for returning up to 1000 businesses based on search criteria. It notes that the API does not return businesses without reviews. A 'Request' section shows the GET method and URL: `https://api.yelp.com/v3/businesses/search`. The 'Parameters' section details two required query string parameters: 'term' (string, optional search term or business name) and 'location' (string, required geographic area). Both descriptions include examples and notes about category filtering.

**/businesses/search**

This endpoint returns up to 1000 businesses based on the provided search criteria. It has some basic information about the business. To get detailed information and reviews, please use the Business ID returned here and refer to [/businesses/{id}](#) and [/businesses/{id}/reviews](#) endpoints.

Note: at this time, the API does not return businesses without any reviews.

**Request**

```
GET https://api.yelp.com/v3/businesses/search
```

**Parameters**

These parameters should be in the query string.

Name	Type	Description
term	string	Optional. Search term, for example "food" or "restaurants". The term may also be business names, such as "Starbucks". If term is not included the endpoint will default to searching across businesses from a small number of popular categories.
location	string	Required if either latitude or longitude is not provided. This string indicates the geographic area to be used when searching for businesses. Examples: "New York City", "NYC", "350 5th Ave, New York, NY 10118". Businesses returned in the response may not be strictly within the specified location.

# Thank You, Yelp!

## Response Body

      },  
      "distance": 1604.23,  
      "transactions": ["pickup", "delivery"]  
    },  
    // ...  
  ],  
  "region": {  
    "center": {  
      "latitude": 37.767413217936834,  
      "longitude": -122.42828739746094  
    }  
  }  
}
```

# Step 4: Build Data Retrieval Plan

We will build a Python script to randomly select over 700 zip codes from the U.S. Census, and then acquire review data from the top-20 Mexican and top-20 Italian restaurants for each zip code using the Yelp API.

11101		07360		20001	
Italian	Mexican	Italian	Mexican	Italian	Mexican
Restaurant	Restaurant	Restaurant	Restaurant	Restaurant	Restaurant
Restaurant	Restaurant	Restaurant	Restaurant	Restaurant	Restaurant
Restaurant	Restaurant	Restaurant	Restaurant	Restaurant	Restaurant
Restaurant	Restaurant	Restaurant	Restaurant	Restaurant	Restaurant
Restaurant	Restaurant	Restaurant	Restaurant	Restaurant	Restaurant

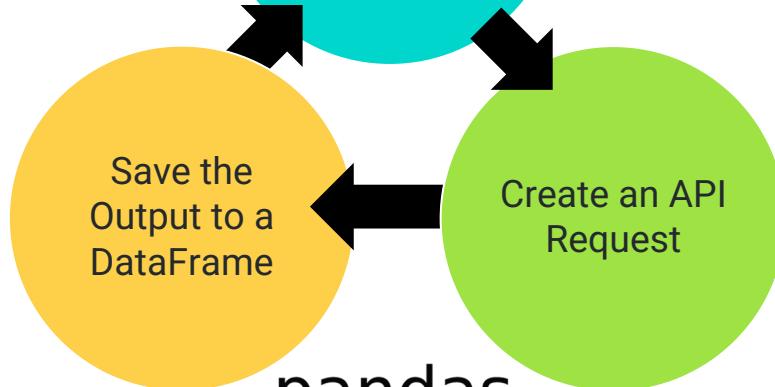

68007		22434		30301	
Italian	Mexican	Italian	Mexican	Italian	Mexican
Restaurant	Restaurant	Restaurant	Restaurant	Restaurant	Restaurant
Restaurant	Restaurant	Restaurant	Restaurant	Restaurant	Restaurant
Restaurant	Restaurant	Restaurant	Restaurant	Restaurant	Restaurant
Restaurant	Restaurant	Restaurant	Restaurant	Restaurant	Restaurant
Restaurant	Restaurant	Restaurant	Restaurant	Restaurant	Restaurant

A diagram illustrating the data retrieval process. It starts with the "United States Census Bureau" logo at the top left. A yellow arrow points from there to a screenshot of the "yelp fusion" website interface at the bottom right. The interface features a red header with the yelp logo and "fusion" text, followed by a light blue main area with a cartoon illustration of industrial machinery.

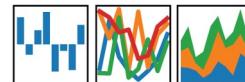

# **Step 5: Retrieve the Data**

# Pulling with Python

---

pandas  
 $y_{it} = \beta' x_{it} + \mu_i + \epsilon_{it}$

# Pulling with Python

---

```
# Use Try-Except to handle errors
try:

    # Loop through all records to calculate the review count and weighted review value
    for business in yelp_reviews_italian["businesses"]:

        italian_review_count = italian_review_count + business["review_count"]
        italian_weighted_review = italian_weighted_review + business["review_count"] * business["rating"]

    for business in yelp_reviews_mexican["businesses"]:
        mexican_review_count = mexican_review_count + business["review_count"]
        mexican_weighted_review = mexican_weighted_review + business["review_count"] * business["rating"]

    # Append the data to the appropriate column of the data frames
    italian_data.set_value(index, "Zip Code", row["Zipcode"])
    italian_data.set_value(index, "Italian Review Count", italian_review_count)
    italian_data.set_value(index, "Italian Average Rating", italian_weighted_review / italian_review_count)
    italian_data.set_value(index, "Italian Weighted Rating", italian_weighted_review)

    mexican_data.set_value(index, "Zip Code", row["Zipcode"])
    mexican_data.set_value(index, "Mexican Review Count", mexican_review_count)
    mexican_data.set_value(index, "Mexican Average Rating", mexican_weighted_review / mexican_review_count)
    mexican_data.set_value(index, "Mexican Weighted Rating", mexican_weighted_review)

except:
    print("Uh oh")
```

# **Step 6: Assemble and Clean the Data**

# Cleaning with Pandas

---

No data comes out exactly the way you want it to.

In our case, we needed multiple steps to aggregate the data along our channels of interest.

```
# Combine DataFrames into a single DataFrame  
combined_data = pd.merge(mexican_data, italian_data, on="Zip Code")  
combined_data.head()
```

	Zip Code	Mexican Review Count	Mexican Average Rating	Mexican Weighted Rating	Italian Review Count	Italian Average Rating	Italian Weighted Rating
0	76556	97	4.1134	399	63	3.78571	238.5
1	72039	256	4.11133	1052.2	266	3.81955	1016
2	61606	378	3.64286	1377	66	3.2197	212.5
3	47232	222	4.16892	925.5	420	3.77857	1587
4	60565	2842	3.94053	11199	2829	3.92824	11113

# **Step 7: Analyze for Trends**

# Analyze for Trends (Table)

It's close:

## Display Summary of Results

```
# Model 1: Head-to-Head Review Counts
italian_summary = pd.DataFrame({"Review Counts": italian_data["Italian Review Count"].sum(),
                                 "Rating Average": italian_data["Italian Average Rating"].mean(),
                                 "Review Count Wins": combined_data["Review Count Wins"].value_counts()["Italian"],
                                 "Rating Wins": combined_data["Rating Wins"].value_counts()["Italian"], index=["Italian"]}

mexican_summary = pd.DataFrame({"Review Counts": mexican_data["Mexican Review Count"].sum(),
                                 "Rating Average": mexican_data["Mexican Average Rating"].mean(),
                                 "Review Count Wins": combined_data["Review Count Wins"].value_counts()["Mexican"],
                                 "Rating Wins": combined_data["Rating Wins"].value_counts()["Mexican"], index=["Mexican"]}

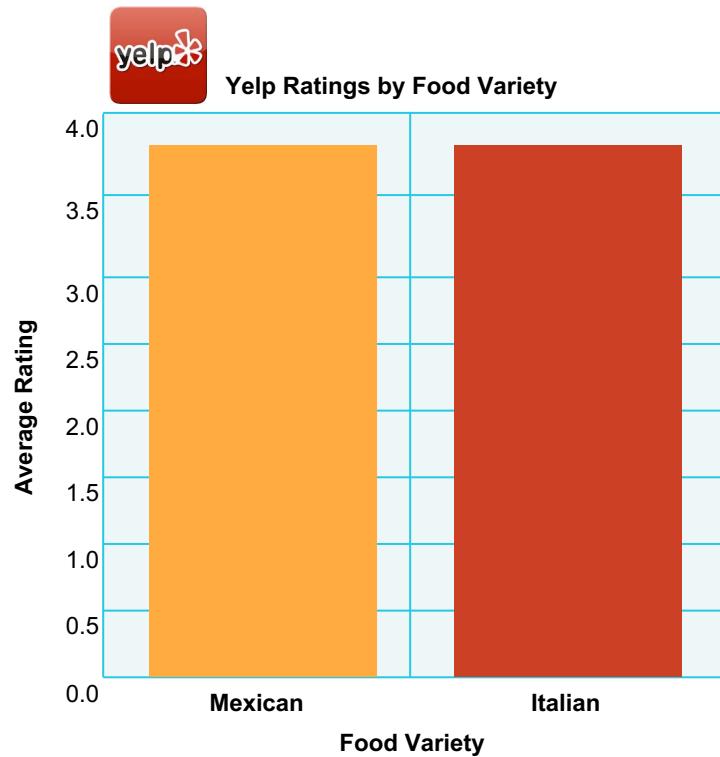

final_summary = pd.concat([mexican_summary, italian_summary])
final_summary
```

	Rating Average	Rating Wins	Review Count Wins	Review Counts	
Mexican	3.826588	273	220	476889	
Italian	3.806869	245	298	573733	

# Analyze for Trends (Ratings)

Yelpers rate Italian and Mexican relatively **equally**.

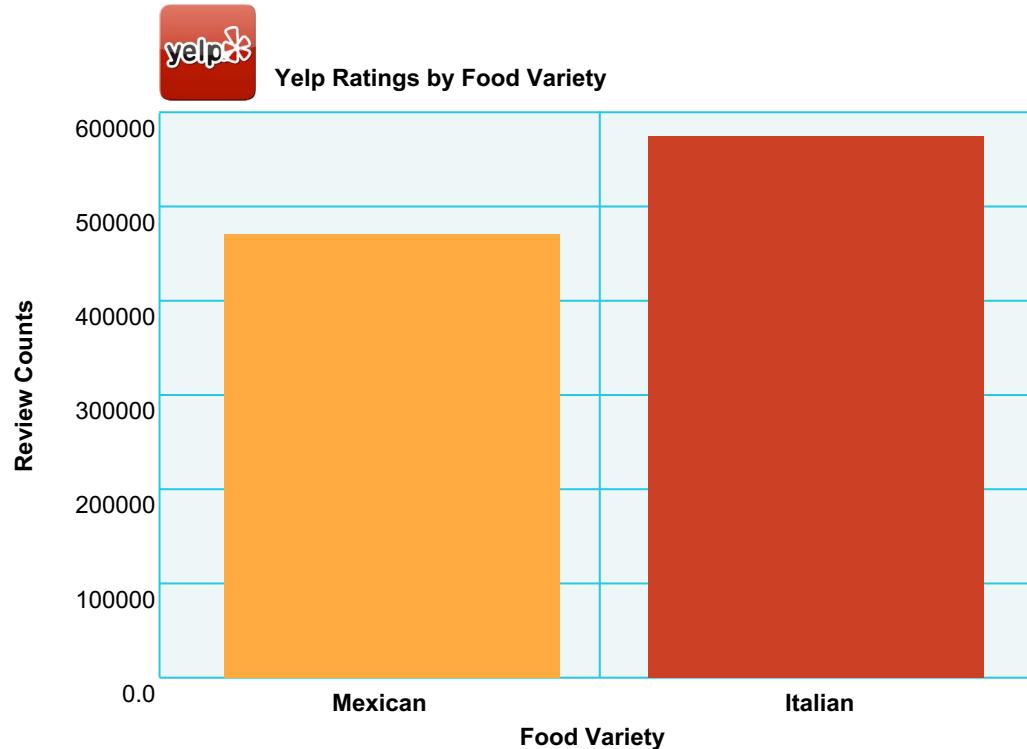

=

# Analyze for Trends (Ratings)

Yelpers seem to **review significantly more Italian** restaurants.

# Analyze for Trends (Statistical Analysis)

---

We have an intuitive sense that the numbers are close, but to quantify our intuition, we use a Student's t-test. After performing the t-test, we can quantifiably state that the differences are not statistically significant

Metric	Italian	Mexican	p-value (t-test)
Average Rating	3.806	3.826	0.284
Review Counts	573k	476k	0.057

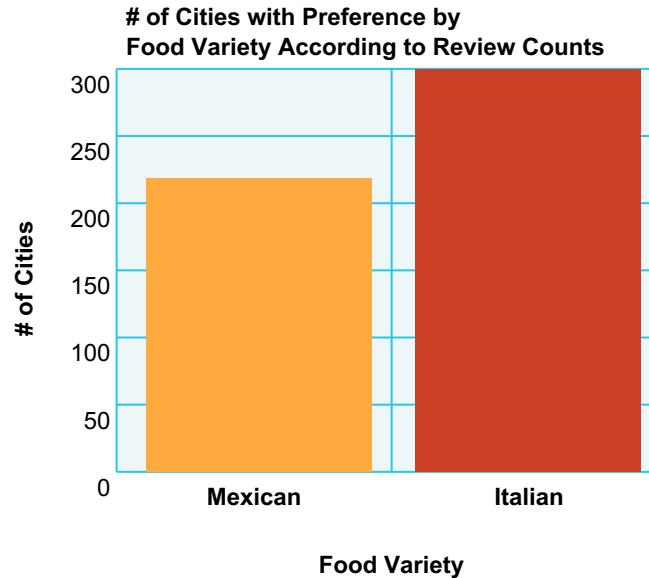

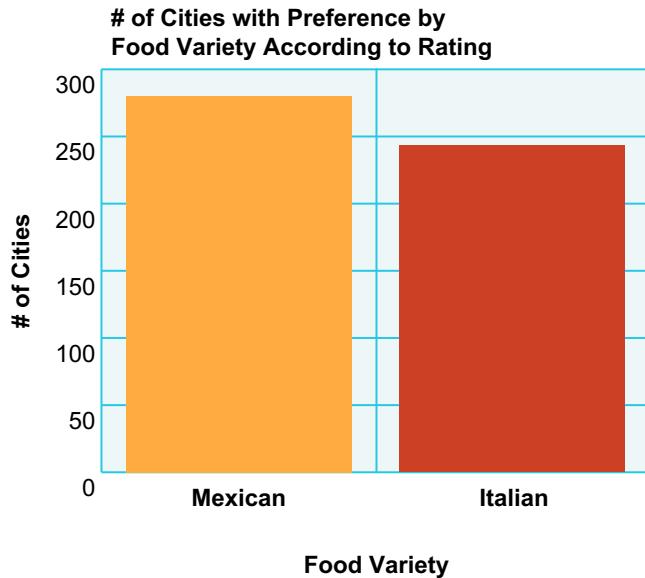

The difference in review count is **not statistically significant**.

# Analyze for Trends (Winner Take All)

Just for fun, let's throw in an analysis that aggregates the data from all cities using a winner-take-all approach.

**It's sort of a wash.**

# **Step 8: Acknowledge Limitations**

# Limitations of Analysis

Yelp demographics may not match the American demographic.

# Limitations of Analysis

---

Restaurant experiences do not equate to home-cooked meals.

# Limitations of Analysis

---

Fine-dining effect?

# **Step 9: Make the Call**

# Making the Call

---

## The “Proper” Conclusion:

Based on our analysis, it's clear that Americans' preferences for Italian and Mexican food are similar in nature. As a whole, Americans rate Mexican and Italian restaurants at statistically similar scores (avg. score: 3.8, p-value: 0.285). However, there is substantial evidence that Americans write more reviews of Italian restaurants than Mexican restaurants (+96k, p-value: 0.057).

This may indicate there is an increased interest in visiting Italian restaurants “for the experience.” Or it may merely suggest that Yelp users enjoy writing reviews of Italian restaurants more than Mexican restaurants.

# Making the Call

---

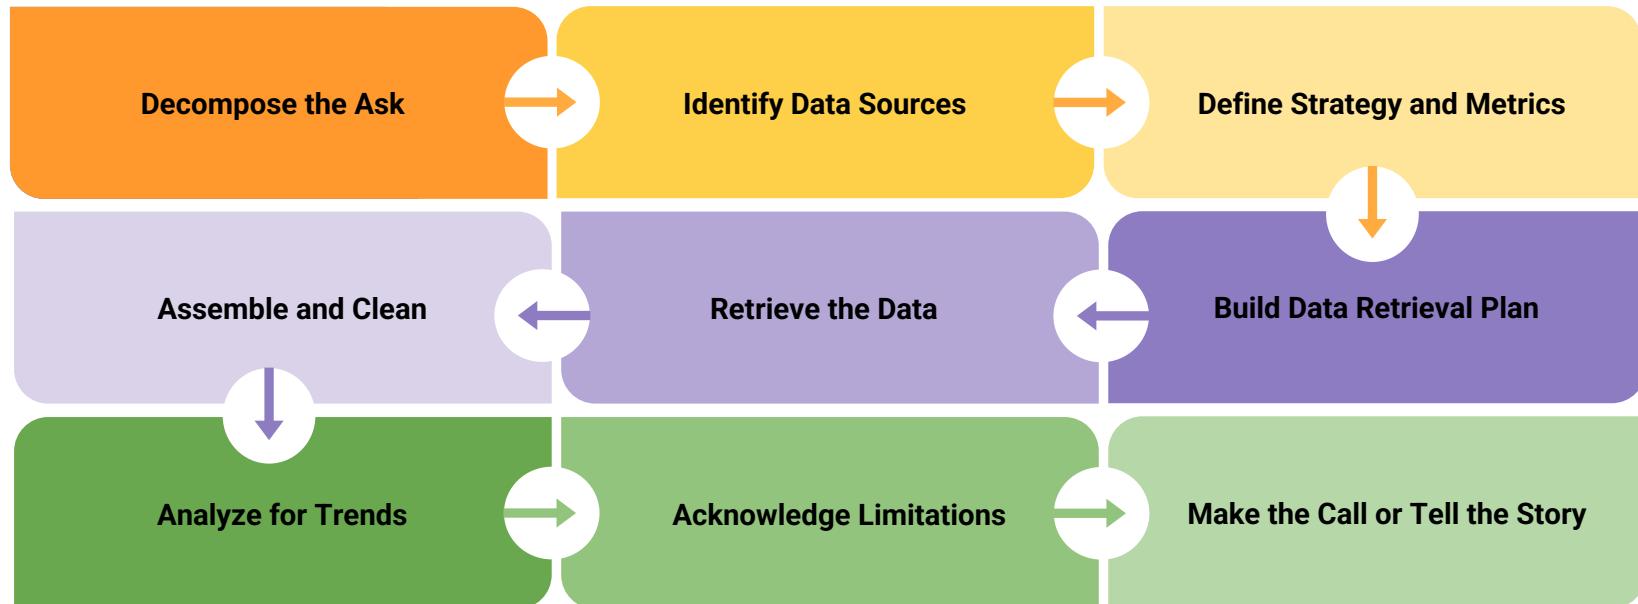

**The “Let’s Be Real” Conclusion:** Italian (but it’s going to be close).

# An Analytics Paradigm

# Analytics Paradigm

Regardless of type or industry, this paradigm provides a repeatable pathway for effective data problem-solving.

# Group Activity: Predicting Gentrification

Using the analytics paradigm as a framework, outline a strategy to identify which neighborhoods in our city are seeing signs of gentrification.

Suggested Time:

---

15 minutes

# Group Activity: Predicting Gentrification

---

Specifically, how would you answer these questions:

-  What observable signs can we detect to suggest gentrification is happening?
-  What means can we use to determine how long the trend has been happening?
-  What proxies might we use to identify gentrification in non-obvious ways?
-  How might you create a visualization of this data to best “tell the story”?

Pay special attention to details like:

-  What data will you use to build your model?
-  How will you retrieve the data?
-  What does your final “story” look like?

Time's Up! Let's Review.

# Prepare for Next Class

---

By next class:

01

Make certain that you have Microsoft Excel installed.

02

Make certain that you have Slack installed and your are actively checking it.

03

Figure out where the Git repository for our class is.

04

Figure out where class videos will be posted.

# Questions?
